Furthermore, because of increases in average life expectancy, each new generation can expect to live longer than their parents' generation and certainly longer than their grandparents' generation. Think of it another way: a 10-year-old child today has a 50 percent chance of living to the age of 104. Some demographers have even speculated that the first person ever to live to be 150 is ...

2.1 Single Nucleotide Polymorphisms. The modern unit of genetic variation is the single nucleotide polymorphism or SNP. SNPs are single base-pair changes in the DNA sequence that occur with high frequency in the human genome .For the purposes of genetic studies, SNPs are typically used as markers of a genomic region, with the large majority of them having a minimal impact on biological systems.

Genome-wide association studies (GWAS) have evolved over the last ten years into a powerful tool for investigating the genetic architecture of human disease. In this work, we review the key concepts underlying GWAS, including the architecture of common diseases, the structure of common human genetic variation, technologies for capturing genetic information, study designs, and the statistical ...

Chapter 11: Genome-Wide Association Studies

One classification scheme was developed in the 1970s by Nobel laureate David Baltimore. The Baltimore classification system categorizes viruses based on the type of nucleic acid genome and replication strategy of the virus. The system also breaks down single-stranded RNA viruses into those that are positive strand (+) and negative strand (-).
